IN THE CLAIMS

Please amend the claims as provided below.

1 (Currently amended). A spring fastener comprising; a first side and a second side

opposite the first side, the first side connected to the second side thereby forming a U-shaped

structure.

a bottom portion wherein the first side and the second side are connected,

a first engagement spring, connected to the first side in the vicinity of the bottom portion,

the second side comprising second barbs having second front ends, and

a second engagement spring; connected to the second side in the vicinity of the bottom

portion,

each of the first and second engagement springs having a substantially flat engagement

region with a hindrance portion between the free end and the peak in the vicinity of the peak, the

hindrance portion comprising one to three ripples, each ripple having the form of a depression on

said hindrance portion, the depression having a deepest part, a front side, a back side and a

width, and the hindrance portion having a surface, wherein the depth of each ripple is the

distance between the surface of the hindrance portion and the deepest part of the respective

ripple,

wherein at least one barb is cut from its respective side, flexible, and bent at its respective

front_end.

2 (previously presented). A spring fastener as defined in claim 11, wherein the depth

of the ripple is smaller than 0.2 mm.

Application No.: 10/692,828

Docket No.: TE9A

3 (previously presented). A spring fastener as defined in claim 1, wherein the

hindrance portion comprises ripples, each ripple has the form of a depression, the depression

having a deepest part, a front side, a back side and a width, and the hindrance portion has a

surface, comprises not more than three ripples,

4 (previously presented). A spring fastener as defined in claim 11 made of a material

having a thickness, and wherein the depth of the ripple is smaller than said thickness.

5 (previously presented). A spring fastener as defined in claim 1, wherein the

hindrance portion comprises only one ripple.

6 (previously presented). A spring fastener as defined in claim 11, wherein the ripple

width is larger than the depth of the ripple.

7 (previously presented). A spring fastener as defined in claim 1, wherein the ripple

width is at least twice the size of the depth of the ripple.

8 (previously presented). A spring fastener as defined in claim 6, wherein the ripple

width is in the range of 0.1 to 0.5 mm and the ripple depth is in the range of 0.01 to 0.1 mm.

9 (previously presented). A spring fastener as defined in claim 1, wherein the back

side has a slope in the range of 15 to 30 degrees with regard to the general plane of the hindrance

portion.

Application No.: 10/692,828

Docket No : TE9A

10 (previously presented). A spring fastener as defined in claim 1, wherein the front side

has a higher slope than the back side.

11 (currently amended). A spring fastener comprising a first side and a second side

opposite the first side, the first side connected to the second side thereby forming a U-shaped

structure having a cavity between the first side and the second side, a bottom portion wherein the

first side and the second side are connected, and a top portion, the first side comprising first

barbs having first front ends, and a first engagement spring, the first engagement spring

connected to the first side in the vicinity of the bottom portion, the second side comprising

second barbs having second front ends, and a second engagement spring, the second engagement

spring connected to the second side in the vicinity of the bottom portion, each of the first and

second engagement springs having a free end in the vicinity of the top portion, each spring also

comprising a peak and an engagement region with a hindrance portion between the free end and

the peak, the hindrance portion comprising only one ripple having the form of a depression, the

depression having a deepest part, a back side substantially lacking a front side, and a width, the

hindrance portion further having a surface, wherein the depth of the ripple is the distance

between the surface of the hindrance portion and the deepest part of the ripple, said ripple

providing increased removal force, when the fastener is pulled by an extension of a first part

engaged to the first and second barbs, after the fastener has been inserted into a slot of a second

part, the slot having a slot width and edges on which edges the engagement region is engaged,

de la constanta de Constala de de Martindo de Constala Constanta de Constala Constanta de Constala Constanta de Constala Constanta de Constala Cons

the increased removal force being due to the hindrance portion, and wherein the fastener can be

extracted when pulled by the extension without damage to said fastener; and

Docket No.: TE9A

a relief opening in the vicinity of the bottom of the spring fastener.

12 (original). A spring fastener as defined in claim 11, wherein the back side has the

form of a curvature with a gradually decreasing slope.

13 (original). A spring fastener as defined in claim 12, wherein the gradually decreasing

slope has the shape of an arc in the range of 50-70 degrees with a radius in the range of 0.03 -

0.05 mm.

14 (previously presented). A spring fastener as defined in claim 1, wherein the barbs

are selected from a group consisting essentially of:

first barbs being outer barbs and second barbs being inner barbs; and

first barbs being inner barbs and second barbs being inner barbs.

15 (previously presented). A spring fastener as defined in claim 3, wherein the barbs

are selected from a group consisting essentially of:

first barbs being outer barbs and second barbs being inner barbs; and

first barbs being inner barbs and second barbs being inner barbs.

16 (original). A spring fastener as defined in claim 11, wherein the barbs are selected

from a group consisting essentially of:

first barbs being outer barbs and second barbs being inner barbs;

first barbs being outside outer barbs and second barbs being inside outer barbs; and

Application No.: 10/692,828

Docket No.: TE9A

first barbs being inner barbs and second barbs being inner barbs.

17 (original). A spring fastener as defined in claim 12, wherein the barbs are selected

from a group consisting essentially of:

first barbs being outer barbs and second barbs being inner barbs;

first barbs being outside outer barbs and second barbs being inside outer barbs; and

first barbs being inner barbs and second barbs being inner barbs.

18 (cancelled). A spring fastener as defined in claim 14, wherein at least one barb is cut

from its respective side, flexible, and bent at its respective front end.

19 (cancelled). A spring fastener as defined in claim 15, wherein at least one barb is cut

from its respective side, flexible, and bent at its respective front end.

20 (previously presented). A spring fastener as defined in claim 16, wherein at least

one barb is cut from its respective side, flexible, and bent at its respective front end.

21 (previously presented). A spring fastener as defined in claim 17, wherein at least

one barb is cut from its respective side, flexible, and bent at its respective front end.

22 (currently amended). A spring fastener as defined in claim [14] 1, wherein the

material from which the spring fastener was made from has a thickness, and the front ends of the

Application No.: 10/692,828

Docket No.: TE9A

outside outer barbs are at a distance from the second side smaller than the thickness of said

material.

23 (previously presented). A spring fastener as defined in claim 17, wherein the

material from which the spring fastener was made from has a thickness, and the front ends of the

outside outer barbs are at a distance from the second side smaller than the thickness of said

material.

24 (previously presented). A spring fastener as defined in claim 11, wherein the

material from which the spring fastener was made from has a thickness, and the front ends of the

outside outer barbs are at a distance from the second side smaller than the thickness of said

material.

25 (previously presented). A spring fastener as defined in claim 11, wherein the

fastener has a width in the vicinity of the top portion of the fastener which is at least 60% as wide

as the slot width.

26 (previously presented). A spring fastener as defined in claim 1, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

27 (previously presented). A spring fastener as defined in claim 3, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

Application No.: 10/692,828

Docket No.: TE9A

28 (previously presented). A spring fastener as defined in claim 11, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

29 (previously presented). A spring fastener as defined in claim 12, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

30 (previously presented). A spring fastener as defined in claim 11, further comprising

additional lower barbs pointing inwardly and originating from the vicinity of the bottom portions

of the first side and the second side of the fastener.

31 (previously presented). A spring fastener as defined in claim 11, wherein each side

of the spring fastener has only one upper barb and one lower barb, the upper barb of one side

facing the lower barb of the other side and vice versa.

32 (cancelled). A spring fastener as defined in claim 11, further comprising a relief

opening in the vicinity of the bottom of the spring fastener.

33 (currently amended). An assembly of a first part, the first part comprising an

extension and a spring fastener, the spring fastener comprising a first side and a second side

opposite the first side, the first side connected to the second side thereby forming a U-shaped

structure,

a bottom portion wherein the first side and the second side are connected, and

Application No.: 10/692,828

Docket No.: TE9A

a first engagement spring, connected to the first side in the vicinity of the bottom portion,

the second side comprising second barbs, the first and second barbs engaging the extension of

the first part, second front ends, and

a second engagement spring, connected to the second side in the vicinity of the bottom

portion, each of the first and second engagement springs having a free end in the vicinity of the

top portion,

each spring also comprising a peak and a substantially flat engagement region with a

hindrance portion comprising one to three ripples, each ripple having the form of a depression on

said hindrance portion, the depression having a deepest part, a front side, a back side and a

width, and the hindrance portion having a surface, wherein the depth of each ripple is the

distance between the surface of the hindrance portion and the deepest part of the respective

ripple;

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end.

34 (previously presented). An assembly as defined in claim 38, wherein the depth of

the ripple is smaller than 0.2 mm.

35 (previously presented). An assembly as defined in claim 33, wherein the hindrance

portion comprises ripples, each ripple has the form of a depression.

36 (previously presented). An assembly as defined in claim 33, wherein the hindrance

portion comprises only one ripple.

Application No.: 10/692,828

Docket No.: TE9A

37 (previously presented). An assembly as defined in claim 36, wherein the back side

has a slope in the range of 15 to 30 degrees with regard to the general plane of the hindrance

portion.

38 (currently amended). An assembly of a first part, the first part comprising an

extension and a spring fastener, the spring fastener comprising a first side and a second side

opposite the first side, the first side connected to the second side thereby forming a U-shaped

structure having a cavity between the first side and the second side, in which cavity the rib of the

first part is disposed, a bottom portion wherein the first side and the second side are connected.

and a top portion, the first side comprising first barbs having first front ends, and a first

engagement spring, the first engagement spring connected to the first side in the vicinity of the

bottom portion, the second side comprising second barbs, the first and second barbs engaging the

extension of the first part, second front ends, and a second engagement spring, the second

engagement spring connected to the second side in the vicinity of the bottom portion, each of the

first and second engagement springs having a free end in the vicinity of the top portion, each

spring also comprising a peak and an engagement region with a hindrance portion between the

free end and the peak, the hindrance portion comprising only one ripple having the form of a

depression, the depression having a deepest part, a back side, substantially lacking a front side,

and a width, the hindrance portion further having a surface, wherein the depth of each ripple is

the distance between the surface of the hindrance portion and the deepest part of the respective

ripple, said ripple provides increased removal force, when the fastener is pulled by an extension

of a first part engaged to the first and second barbs, after the fastener has been inserted into a slot

Application No.: 10/692,828

Docket No.: TE9A

of a second part, the slot having a slot width and edges on which edges the engagement region is

engaged, the increased removal force being due to the hindrance portion, and wherein the

fastener can be extracted when pulled by the extension without damage to said fastener.

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end,

39 (previously presented). An assembly as defined in claim 38, wherein the back side

has the form of a curvature with a gradually decreasing slope.

40 (previously presented). An assembly as defined in claim 39, wherein the gradually

decreasing slope has the shape of an arc in the range of 50-70 degrees with a radius in the range

of 0.03 -0.05 mm.

41 (previously presented). An assembly as defined in claim 39, wherein the barbs are

selected from a group consisting essentially of:

first barbs being outer barbs and second barbs being inner barbs;

first barbs being outside outer barbs and second barbs being inside outer barbs; and

first barbs being inner barbs and second barbs being inner barbs.

42 (canceled). An assembly as defined in claim 38, wherein at least one barb is cut from

its respective side, is flexible, and is bent at its respective front end.

Application No.: 10/692,828 Docket No.: TE9A

43 (canceled). An assembly as defined in claim 39, wherein at least one barb is cut from

its respective side, is flexible, and is bent at its respective front end.

44 (previously presented). An assembly as defined in claim 41, wherein the material

from which the spring fastener was made from has a thickness, the barbs have front points, and

the front points of the outside outer barbs are at a distance from the second side smaller than the

thickness of said material.

45 (previously presented). An assembly as defined in claim 38, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

46 (previously presented). An assembly as defined in claim 39, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

47 (Currently Amended). An assembly of a second part, the second part having a slot,

and a spring fastener, the spring fastener inserted into the slot, the spring fastener comprising a

first side and a second side opposite the first side, the first side connected to the second side

thereby forming a U-shaped structure,

a bottom portion wherein the first side and the second side are connected,

a first engagement spring connected to the first side in the vicinity of the bottom portion,

the second side comprising second barbs having second front ends, and

a second engagement spring connected to the second side in the vicinity of the bottom

portion.

Application No.: 10/692,828

Docket No.: TE9A

each of the first and second engagement springs having a substantially flat engagement

region with a hindrance portion between the free end and the peak in the vicinity of the peak, the

hindrance portion comprising one to three ripples, each ripple having the form of a depression on

said hindrance portion, the depression having a deepest part, a front side, a back side and a

width, and the hindrance portion having a surface, wherein the depth of each ripple is the

distance between the surface of the hindrance portion and the deepest part of the respective

ripple,

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end.

48 (previously presented). An assembly as defined in claim 52, wherein the depth of

the ripple is smaller than 0.2 mm.

49 (previously presented). An assembly as defined in claim 47, wherein the hindrance

portion comprises ripples, each ripple has the form of a depression.

50 (previously presented). An assembly as defined in claim 47, wherein the hindrance

portion comprises only one ripple.

51 (previously presented). An assembly as defined in claim 50, wherein the back side

has a slope in the range of 15 to 30 degrees with regard to the general plane of the hindrance

portion.

Application No.: 10/692,828

Docket No.: TE9A

52 (currently amended). An assembly of a second part, the second part having a slot,

and a spring fastener, the spring fastener inserted into the slot, the spring fastener comprising a

first side and a second side opposite the first side, the first side connected to the second side

thereby forming a U-shaped structure having a cavity between the first side and the second side,

in which cavity the rib of the first part is disposed, a bottom portion wherein the first side and the

second side are connected, and a top portion, the first side comprising first barbs having first

front ends, and a first engagement spring, the first engagement spring connected to the first side

in the vicinity of the bottom portion, the second side comprising second barbs having second

front ends, and a second engagement spring, the second engagement spring connected to the

second side in the vicinity of the bottom portion, each of the first and second engagement

springs having a free end in the vicinity of the top portion, each spring also comprising a peak

and an engagement region with a hindrance portion between the free end and the peak, the

hindrance portion comprising only one ripple having the form of a depression, the depression

having a deepest part, a back side, substantially lacking a front side, and a width, the hindrance

portion further having a surface, wherein the depth of each ripple is the distance between the surface of the hindrance portion and the deepest part of the respective ripple, said ripple provides

increased removal force, when the fastener is pulled by an extension of a first part engaged to the

first and second barbs, after the fastener has been inserted into a slot of a second part, the slot

having a slot width and edges on which edges the engagement region is engaged, the increased

removal force being due to the hindrance portion, and wherein the fastener can be extracted

when pulled by the extension without damage to said fastener,

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end.

Docket No.: TE9A

53 (previously presented). An assembly as defined in claim 52, wherein the back side

has the form of a curvature with a gradually decreasing slope.

54 (previously presented). An assembly as defined in claim 53, wherein the gradually

decreasing slope has the shape of an arc in the range of 50-70 degrees with a radius in the range

of 0.03 -0.05 mm.

55 (previously presented). An assembly as defined in claim 53, wherein the barbs are

selected from a group consisting essentially of:

first barbs being outer barbs and second barbs being inner barbs;

first barbs being outside outer barbs and second barbs being inside outer barbs; and

first barbs being inner barbs and second barbs being inner barbs.

56 (canceled). An assembly as defined in claim 53, wherein at least one barb is cut from

its respective side, is flexible, and is bent at its respective front end.

57 (canceled). An assembly as defined in claim 53, wherein at least one barb is cut from

its respective side, is flexible, and is bent at its respective front end.

58 (previously presented). An assembly as defined in claim 55, wherein the material

from which the spring fastener was made from has a thickness, the barbs have front points, and

Application No.: 10/692,828

Docket No.: TE9A

the front points of the outside outer barbs are at a distance from the second side smaller than the

thickness of said material.

59 (previously presented). An assembly as defined in claim 52, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

60 (previously presented). An assembly as defined in claim 53, wherein the

engagement region is at least partially wider than the rest of the engagement spring.

61 (currently amended). A vehicle comprising an assembly of a first part, the first

part comprising an extension, and a second part, the second part having a slot, the first part and

the second part connected with a spring fastener, the spring fastener inserted into the slot, the

spring fastener comprising a first side and a second side opposite the first side, the first side

connected to the second side thereby forming a U-shaped structure, a bottom portion wherein the

first side and the second side are connected.

a first engagement spring connected to the first side in the vicinity of the bottom portion,

the second side comprising second barbs, the first and second barbs engaging the extension of

the first part, second front ends, and

a second engagement spring connected to the second side in the vicinity of the bottom

portion.

each of the first and second engagement springs having a substantially flat engagement

region with a hindrance portion between the free end and the peak in the vicinity of the peak, the

hindrance portion comprising one to three ripples, each ripple having the form of a depression on

Application No.: 10/692,828

Docket No.: TE9A

said hindrance portion, the depression having a deepest part, a front side, a back side and a

width, and the hindrance portion having a surface, wherein the depth of each ripple is the

distance between the surface of the hindrance portion and the deepest part of the respective

ripple

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end.

62 (previously presented). A vehicle as defined in claim 66, wherein the depth of the

ripple is smaller than 0.2 mm,

63 (previously presented). A vehicle as defined in claim 61, wherein the hindrance

portion comprises not more than three ripples, and wherein the depth of each ripple is the

distance between the surface of the hindrance portion and the deepest part of the respective

ripple.

64 (previously presented). A vehicle as defined in claim 61, wherein the hindrance

portion comprises one ripple.

65 (previously presented). A vehicle as defined in claim 64, wherein the back side has

a slope in the range of 15 to 30 degrees with regard to the general plane of the hindrance portion.

66 (currently amended). A vehicle comprising an assembly of a first part, the first

part comprising an extension, and a second part, the second part having a slot, the first part and

Application No.: 10/692,828

Docket No.: TE9A

the second part connected with a spring fastener, the spring fastener comprising a first side and a

second side opposite the first side, the first side connected to the second side thereby forming a

U-shaped structure having a cavity between the first side and the second side, a bottom portion

wherein the first side and the second side are connected, and a top portion, the first side

comprising first barbs having first front ends, and a first engagement spring, the first

engagement spring connected to the first side in the vicinity of the bottom portion, the second

side comprising second barbs having second front ends, and a second engagement spring, the

second engagement spring connected to the second side in the vicinity of the bottom portion,

each of the first and second engagement springs having a free end in the vicinity of the top

portion, each spring also comprising a peak and an engagement region with a hindrance portion

between the free end and the peak, the hindrance portion comprising only one ripple having the

form of a depression, the depression having a deepest part, a back side substantially lacking a

front side, and a width, the hindrance portion further having a surface, wherein the depth of the

ripple is the distance between the surface of the hindrance portion and the deepest part of the

ripple, said ripple providing increased removal force, when the fastener is pulled by an extension

of a first part engaged to the first and second barbs, after the fastener has been inserted into a slot

of a second part, the slot having a slot width and edges on which edges the engagement region is engaged, the increased removal force being due to the hindrance portion, and wherein the

fastener can be extracted when pulled by the extension without damage to said fastener

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end.

Application No.: 10/692,828

Docket No.: TE9A

67 (previously presented). A vehicle as defined in claim 66, wherein the back side has

the form of a curvature with a gradually decreasing slope.

68 (previously presented). A vehicle as defined in claim 67, wherein the gradually

decreasing slope has the shape of an arc in the range of 50-70 degrees with a radius in the range

of 0.03 -0.05 mm.

69 (previously presented). A vehicle as defined in claim 67, wherein the barbs are

selected from a group consisting essentially of:

first barbs being outer barbs and second barbs being inner barbs;

first barbs being outside outer barbs and second barbs being inside outer barbs; and

first barbs being inner barbs and second barbs being inner barbs.

70 (canceled). A vehicle as defined in claim 67, wherein at least one barb is cut from its

respective side, is flexible, and is bent at its respective front end.

71 (canceled). A vehicle as defined in claim 67, wherein at least one barb is cut from its

respective side, is flexible, and is bent at its respective front end.

72 (previously presented). A vehicle as defined in claim 69, wherein the material from

which the spring fastener was made from has a thickness, the barbs have front points, and the

front points of the outside outer barbs are at a distance from the second side smaller than the

thickness of said material

Application No.: 10/692,828

Docket No.: TE9A

73 (previously presented). A vehicle as defined in claim 66, wherein the engagement

region is at least partially wider than the rest of the engagement spring.

74 (previously presented). A vehicle as defined in claim 67, wherein the engagement

region is at least partially wider than the rest of the engagement spring.

75 (Currently Amended). A spring fastener comprising a first side and a second side

opposite the first side, the first side connected to the second side thereby forming a U-shaped

structure.

a bottom portion wherein the first side and the second side are connected,

a first engagement spring connected to the first side in the vicinity of the bottom portion,

the second side comprising second barbs second front ends, and

a second engagement spring connected to the second side in the vicinity of the bottom

portion,

each of the first and second engagement springs having an engagement region with a

hindrance portion between the free end, and the peak, the hindrance portion comprising one

structure selected from ripple, side rib, upward solid bent extension parallel to the peak and the

free end, knurled region, each having a depth, and a combination thereof;

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end.

Application No.: 10/692,828

Docket No.: TE9A

76 (previously presented) A vehicle comprising parts connected with a spring

fastener, the spring fastener comprising a first side and a second side opposite the first side, the

first side connected to the second side thereby forming a U-shaped structure,

a bottom portion wherein the first side and the second side are connected,

a first engagement spring connected to the first side in the vicinity of the bottom portion,

the second side comprising second barbs second front ends, and

a second engagement spring connected to the second side in the vicinity of the bottom

portion,

each of the first and second engagement springs having an engagement region with a

hindrance portion between the free end, and the peak, the hindrance portion comprising one

structure selected from ripple, side rib, upward solid bent extension parallel to the peak and the

free end, knurled region, each having a depth, and a combination thereof;

wherein at least one barb is cut from its respective side, is flexible, and is bent at its

respective front end.

77 (previously presented). A spring fastener as defined in claim 1, further comprising

a molded elastic body at least on the spring fastener.

78 (previously presented). A spring fastener as defined in claim 1, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion.

Application No.: 10/692,828

Docket No.: TE9A

79 (previously presented). A spring fastener as defined in claim 11, further comprising

a molded elastic body at least under the top portion of said spring fastener.

80 (previously presented). A spring fastener as defined in claim 11, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip

81 (previously presented). A spring fastener as defined in claim 12, further comprising

a molded elastic body at least under the top portion of said spring fastener.

82 (previously presented). A spring fastener as defined in claim 12, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

83 (previously presented). An assembly as defined in claim 33, further comprising a

molded elastic body at least under the top portion of the spring fastener.

84 (previously presented). A spring fastener as defined in claim 33, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

85 (previously presented). An assembly as defined in claim 38, further comprising a

molded elastic body at least under the top portion of the spring fastener.

Docket No.: TE9A

86 (previously presented). A spring fastener as defined in claim 38, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

87 (previously presented). An assembly as defined in claim 39, further comprising a

molded elastic body at least under the top portion of the spring fastener.

88 (previously presented). A spring fastener as defined in claim 39, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

89 (previously presented). An assembly as defined in claim 47, further comprising a

molded elastic body at least under the top portion of the spring fastener.

90 (previously presented). A spring fastener as defined in claim 47, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

91 (previously presented). An assembly as defined in claim 52, further comprising a

molded elastic body at least under the top portion of the spring fastener.

Application No.: 10/692,828

Docket No.: TE9A

92 (previously presented). A spring fastener as defined in claim 52, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

93 (previously presented). An assembly as defined in claim 53, further comprising a

molded elastic body at least under the top portion of the spring fastener.

94 (previously presented). A spring fastener as defined in claim 53, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

95 (previously presented). A vehicle as defined in claim 61, further comprising a

molded elastic body at least under the top portion of the spring fastener.

96 (previously presented). A spring fastener as defined in claim 61, further comprising

an elastic body in the form of a gasket extending away from the cavity in the vicinity of the top

portion, the gasket comprising a lip.

97 (previously presented). A vehicle as defined in claim 66, further comprising a

molded elastic body at least under the top portion of the spring fastener.

Application No.: 10/692,828

Docket No.: TE9A
